OUR SPECIALTIES

Cotton Fabric: The coveralls we provide are constructed from premium cotton threads, skilfully created with a strong twill pattern on water jet looms. This fabric undergoes careful dyeing and treatment to guarantee rich, enduring pigmentation. To supply superior resilience, ease, and an ideal fit, the textile is additionally sanforised, mercerized, and pre-shrunk.

Anti-Static Material: Tailored specifically for gas transport and tanker use, this suit is fashioned from materials that resist static electricity to guarantee maximum protection in areas susceptible to static buildup. It perfectly suits strenuous work environments by offering steadfast safety without sacrificing wearability or toughness.

UV-Resistant Textiles: Our ultraviolet-protective coveralls are engineered to absorb harmful rays, supplying outstanding defense against the sun. These garments are perfect for exterior worksites, delivering both coziness and protection during sun exposure.

Seam Construction: Seams are created with premium international machinery utilizing a five-thread method, which guarantees flawless interlocking for increased hardness. This strong sewing technique incorporates triple stitching and reinforced hemming to supply exceptional toughness and extended usability.

Quality Assurance Testing: Fabrics are evaluated in batches for color retention, shrinkage, and overall strength to verify they adhere to strict quality criteria and function consistently long-term. These assessments ensure the textile's robustness and structural soundness, even following numerous laundering cycles and prolonged wear.

Reflective Striping: Saffrix Solutions applies premium retro-reflective materials tailored to customer specifications. For optimal prominence and security in poorly lit areas, the suits are outfitted with 50 mm (2.0 in) fire-retardant reflective bands positioned deliberately across the back, legs, arms, and shoulders.
